

Executive Summary for scottyab/rootbeer Project

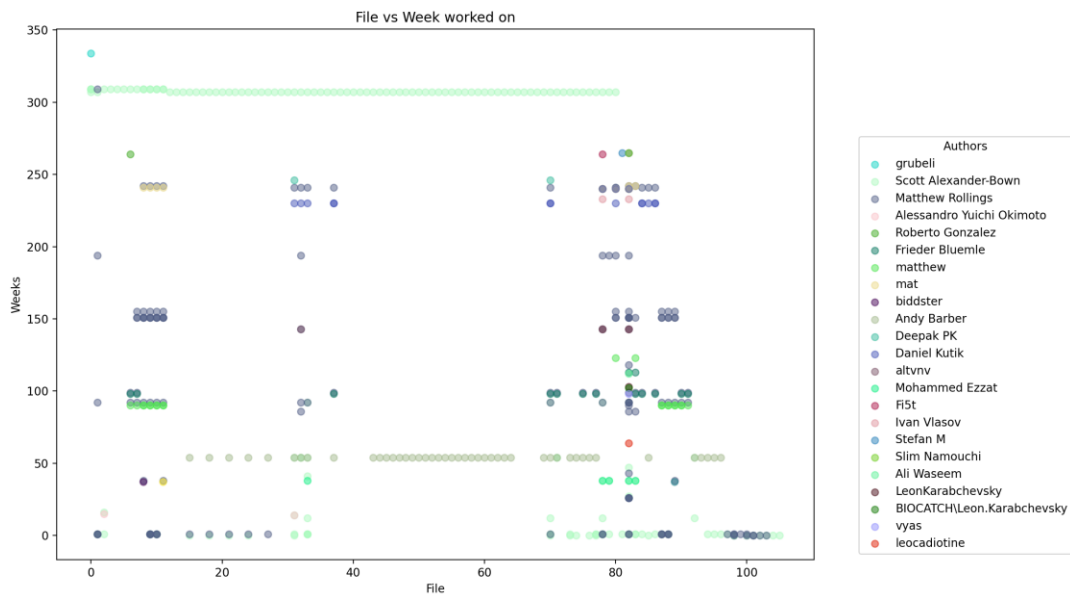

Introduction

This is a report that details the authors and commit history for the scottyab/rootbeer repository. The first commit for the repository was on 06/19/2015. The scatterplot provided details which file was touched on the x-axis and how many weeks since the first commit for the repository on the y-axis. The color of the data point details which author it was.

The scatterplot takes information based on src/ file directory. In scottyab/rootbeer there are two file paths with src/. There are rootbeerlib/src and app/src and data is gathered from both.

Findings

There have been over 300 weeks since the first commit in the project with many different authors contributing. It is difficult to tell from the graph but some of the more prominent authors are Scott Alexander-Bown who made many commits to every file recently. Andy Barber also made many commits around 50 weeks since the start of the project. The person with the most recent commit has been Grubeli, around 340 weeks since the start of the project.

Useful Git Commands

The git commands I found the most useful are commands like `git checkout -b <branch-name>` to create a new branch and switch to it in 1 single command. `Git add (. or <filenames>)` to either add all the files I wanted to commit or specific ones. `Git pull` is obviously also very important as it allows me to send my commits up to the remote repository on GitHub.
